

- CREATION series -
CREATION VARI. ND2.5-ND500

Marumi is pleased to expand CREATION VARI. ND2.5-ND500 by adding **67mm** to meet increasing demand for the Variable ND filter.

Variable Range

Light Intensity	1/2.5 to 1/500
Exposure Value	1 1/3 stops to 9.0 stops
Density	0.4 to 2.7

Available Size

58 mm

NEW

67
mm

77 mm

82 mm

MADE IN JAPAN

Key Features

- Slim profile frame (thickness: **5.9mm** without thread) to prevent vignetting
- Multi-coating for low reflections (3 layers on each side, total 6 layers)
- Satin finished frame
- Knurling on the frame for easy operation
- Blackened outer rim for reducing inner reflections

[REMARK]

In the range of high density, the cross pattern image may happen depending on shooting condition.

Unique Usage of Variable ND

For easy focus adjustment with ND filter

It is not easy to adjust focus when using the high density ND filter because the finder becomes dark. The ND filter has to be detached before taking a picture to adjust focus. When using the variable ND filter, the finder can be bright by only rotating the filter ring to lower density. There is no need to detach the filter when adjusting focus.

Mandatory for DSLR movie

When shooting movie with DSLR under bright condition, such as outdoor under fine weather, the shutter speed tends to go up 1/500, 1/1000 sec., all the more when fixing the aperture for the desired depth of field. The movie with high shutter speed is likely to be flash motion. The variable ND filter is very useful to avoid it.

* The video camera is equipped with ND filter inside to avoid this, but DSLR is NOT.
